

Engineering Department

The Engineering Department at Nexora Technologies is the backbone of product development and infrastructure management. It is divided into multiple specialized teams that collaborate across product lifecycles.

The department is led by Rohan Malhotra, Head of Engineering, who reports directly to the CTO. The department is structured into Backend Engineering, Frontend Engineering, DevOps, QA, and AI Research teams.

Technology Stack

The engineering teams primarily use:

- Python for AI and backend services
- Java for enterprise-grade backend systems
- React.js for frontend development
- PostgreSQL and MongoDB for database management
- Docker and Kubernetes for containerization and orchestration
- Jenkins for CI/CD pipelines

Development Workflow

Nexora follows Agile methodology with 2-week sprint cycles. Each sprint includes planning, development, testing, and deployment stages. Code reviews are mandatory and are conducted via GitHub Enterprise pull requests.

AI model deployments follow a separate MLOps pipeline managed by the AI Research team, ensuring controlled versioning and rollback capability.
